Running Project from git

```
cp .env.example .env
```

Edit `.env` to match your database credentials:

```
composer install
npm install
```

```
php artisan key:generate
```

```
php artisan config:clear
php artisan config:cache
```

If your project handles file uploads, create a symbolic link:

bash
```
php artisan storage:link
```

```
php artisan migrate
```

```
php artisan db:seed
```
